

# **Ansible Vault**

## **(Secrets Management)**

- Ansible Vault is a built-in tool used to encrypt sensitive data like passwords, API keys, or secret tokens.
- It allows you to store encrypted variables, configuration files, or entire playbooks securely.

# Why do we use Ansible Vault?

- To protect secrets in production environments.
- So developers don't expose passwords in Git or public repositories.
- It helps in following security best practices for secret management.
